Chapter 1

Class Index

1.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

accelerometer_inData
: Holds INCOMING accelerometer data, NOT part of the accelerometer driver 5

can_mailbox
: A virtual CAN mailbox for outgoing and incoming messages 8

controller_descriptor 9

current_measurement_descriptor
: Database with key information for the motor current sensing ADCs 10

imu_descriptor
: Key information about the IMUs 12

joint_controller_descriptor
: Joint controller information database 14

motor_descriptor
: Contains static and state information relevant to the operation of a motor driver 17

string_cmd_pair
: Pairs a command string token with a function pointer 21

string_cmd_processor_args
: Wrapper struct to enable a variable number of arguments to the string processor 21

Chapter 2

File Index

2.1 File List

Here is a list of all files with brief descriptions:

accelerometer_driver.h 23
adc_driver.h
This file contains all the function prototypes and struct definitions for the adc_driver.c file . . . 23
can_driver.h
This file contains all the function prototypes and struct definitions for the can_driver.c file . . . 25
gpio_driver.h
This file contains all the function prototypes for the gpio_driver.c file 38
joint_controller.h
This file contains all the function prototypes and struct definitions for the joint_controller.c file . 39
motor_driver.h
This file contains all the function prototypes and struct definitions for the motor_driver.c file . . 65
shoulder_controller.h 76
string_cmd_parser.h
This file contains all the function prototypes and struct definitions for the string_cmd_parser.c file 76
uart_driver.h
This file contains all the function prototypes for the string_cmd_parser.c file 83
unit_config.h
This file contains global information relevant to building the project for a specific STM32 in the robotic arm 85

Chapter 3

Class Documentation

3.1 accelerometer_inData Struct Reference

Holds INCOMING accelerometer data, NOT part of the accelerometer driver.

`#include <joint_controller.h>`

Public Attributes

- int16_t xAcc
  X axis acceleration.
- int16_t xRot
  X axis rotation.
- int16_t yAcc
  Y axis acceleration.
- int16_t yRot
  Y axis rotation.
- int16_t zAcc
  Z axis acceleration.
- int16_t zRot
  Z axis rotation.
- uint8_t newXAcc
  Flags new X acceleration data on arrival.
- uint8_t newYAcc
  Flags new Y acceleration data on arrival.
- uint8_t newZAcc
  Flags new Z acceleration data on arrival.
- uint8_t newXRot
  Flags new X rotation data on arrival.
- uint8_t newYRot
  Flags new Y rotation data on arrival.
- uint8_t newZRot
  Flags new Z rotation data on arrival.

3.1.1 Detailed Description

Holds INCOMING accelerometer data, NOT part of the accelerometer driver.

3.1.2 Member Data Documentation

3.1.2.1 newXAcc

`uint8_t accelerometer_inData::newXAcc`

Flags new X acceleration data on arrival.

3.1.2.2 newXRot

`uint8_t accelerometer_inData::newXRot`

Flags new X rotation data on arrival.

3.1.2.3 newYAcc

`uint8_t accelerometer_inData::newYAcc`

Flags new Y acceleration data on arrival.

3.1.2.4 newYRot

`uint8_t accelerometer_inData::newYRot`

Flags new Y rotation data on arrival.

3.1.2.5 newZAcc

`uint8_t accelerometer_inData::newZAcc`

Flags new Z acceleration data on arrival.

3.1.2.6 newZRot

```
uint8_t accelerometer_inData::newZRot
```

Flags new Z rotation data on arrival.

3.1.2.7 xAcc

```
int16_t accelerometer_inData::xAcc
```

X axis acceleration.

3.1.2.8 xRot

```
int16_t accelerometer_inData::xRot
```

X axis rotation.

3.1.2.9 yAcc

```
int16_t accelerometer_inData::yAcc
```

Y axis acceleration.

3.1.2.10 yRot

```
int16_t accelerometer_inData::yRot
```

Y axis rotation.

3.1.2.11 zAcc

```
int16_t accelerometer_inData::zAcc
```

Z axis acceleration.

3.1.2.12 zRot

```
int16_t accelerometer_inData::zRot
```

Z axis rotation.

The documentation for this struct was generated from the following file:

- joint_controller.h

3.2 can_mailbox Struct Reference

A virtual CAN mailbox for outgoing and incoming messages.

```
#include <can_driver.h>
```

Public Attributes

- uint8_t newMsg
  Flag signifying that the mailbox contains an unhandled message.
- uint32_t msgId
  CAN message ID, 11 bits (standard ID)
- uint8_t data [8]
  CAN message data.

3.2.1 Detailed Description

A virtual CAN mailbox for outgoing and incoming messages.

3.2.2 Member Data Documentation

3.2.2.1 data

```
uint8_t can_mailbox::data[8]
```

CAN message data.

3.2.2.2 msgId

```
uint32_t can_mailbox::msgId
```

CAN message ID, 11 bits (standard ID)

3.2.2.3 newMsg

```
uint8_t can_mailbox::newMsg
```

Flag signifying that the mailbox contains an unhandled message.

The documentation for this struct was generated from the following file:

- can_driver.h

3.3 controller_descriptor Struct Reference

```
#include <shoulder_controller.h>
```

Public Attributes

- uint8_t inputSource
- float posSetpoint
- float posCurrent
- float posError
- uint8_t isMoving

3.3.1 Member Data Documentation

3.3.1.1 inputSource

```
uint8_t controller_descriptor::inputSource
```

3.3.1.2 isMoving

```
uint8_t controller_descriptor::isMoving
```

3.3.1.3 posCurrent

```
float controller_descriptor::posCurrent
```

3.3.1.4 posError

```
float controller_descriptor::posError
```

3.3.1.5 posSetpoint

```
float controller_descriptor::posSetpoint
```

The documentation for this struct was generated from the following file:

- shoulder_controller.h

3.4 current_measurement_descriptor Struct Reference

Database with key information for the motor current sensing ADCs.

```
#include <adc_driver.h>
```

Public Attributes

- double VrefA
  Analog reference voltage, V.
- double Ripropi
  Current sense resistor, Ohm.
- double Aipropi
  Current sense proportional current, uA/A.
- uint32_t Nadc
  ADC saturation point.
- ADC_HandleTypeDef * adc
  ADC for current measurement.
- double conversionConst
  Constant number for conversion of ADC value to Ampere.
- uint32_t lastReading
  Latest ADC raw value.
- double lastMeasurement
  Latest calculated current.

3.4.1 Detailed Description

Database with key information for the motor current sensing ADCs.

3.4.2 Member Data Documentation

3.4.2.1 adc

```
ADC_HandleTypeDef* current_measurement_descriptor::adc
```

ADC for current measurement.

3.4.2.2 Aipropi

```
double current_measurement_descriptor::Aipropi
```

Current sense proportional current, uA/A.

3.4.2.3 conversionConst

```
double current_measurement_descriptor::conversionConst
```

Constant number for conversion of ADC value to Ampere.

3.4.2.4 lastMeasurement

```
double current_measurement_descriptor::lastMeasurement
```

Latest calculated current.

3.4.2.5 lastReading

```
uint32_t current_measurement_descriptor::lastReading
```

Latest ADC raw value.

3.4.2.6 Nadc

```
uint32_t current_measurement_descriptor::Nadc
```

ADC saturation point.

3.4.2.7 Ripropi

```
double current_measurement_descriptor::Ripropi
```

Current sense resistor, Ohm.

3.4.2.8 VrefA

```
double current_measurement_descriptor::VrefA
```

Analog reference voltage, V.

The documentation for this struct was generated from the following file:

- adc_driver.h

3.5 imu_descriptor Struct Reference

Key information about the IMUs.

```
#include <accelerometer_driver.h>
```

Public Attributes

- I2C_HandleTypeDef * i2cHandle
  Pointer to the I2C bus peripheral.
- uint16_t readAddr
  Read address of the IMU on the I2C bus.
- uint16_t writeAddr
  Write address of the IMU on the I2C bus.
- uint8_t xAccAddr
  Start address of the IMU's X axis accelerometer register.
- uint8_t yAccAddr
  Start address of the IMU's Y axis accelerometer register.
- uint8_t zAccAddr
  Start address of the IMU's Z axis accelerometer register.
- uint8_t xRotAddr
  Start address of the IMU's X axis rotation rate register.
- uint8_t yRotAddr
  Start address of the IMU's Y axis rotation rate register.
- uint8_t zRotAddr
  Start address of the IMU's Z axis rotation rate register.

3.5.1 Detailed Description

Key information about the IMUs.

3.5.2 Member Data Documentation

3.5.2.1 i2cHandle

```
I2C_HandleTypeDef* imu_descriptor::i2cHandle
```

Pointer to the I2C bus peripheral.

3.5.2.2 readAddr

```
uint16_t imu_descriptor::readAddr
```

Read address of the IMU on the I2C bus.

3.5.2.3 writeAddr

```
uint16_t imu_descriptor::writeAddr
```

Write address of the IMU on the I2C bus.

3.5.2.4 xAccAddr

```
uint8_t imu_descriptor::xAccAddr
```

Start address of the IMU's X axis accelerometer register.

3.5.2.5 xRotAddr

```
uint8_t imu_descriptor::xRotAddr
```

Start address of the IMU's X axis rotation rate register.

3.5.2.6 yAccAddr

```
uint8_t imu_descriptor::yAccAddr
```

Start address of the IMU's Y axis accelerometer register.

3.5.2.7 yRotAddr

```
uint8_t imu_descriptor::yRotAddr
```

Start address of the IMU's Y axis rotation rate register.

3.5.2.8 zAccAddr

```
uint8_t imu_descriptor::zAccAddr
```

Start address of the IMU's Z axis accelerometer register.

3.5.2.9 zRotAddr

```
uint8_t imu_descriptor::zRotAddr
```

Start address of the IMU's Z axis rotation rate register.

The documentation for this struct was generated from the following file:

- accelerometer_driver.h

3.6 joint_controller_descriptor Struct Reference

Joint controller information database.

```
#include <joint_controller.h>
```

Public Attributes

- uint8_t hasAccelerometer

  Whether the joint has an accelerometer for position control.
- float posSetpoint

  The joint's setpoint in radians/mm relative to its zero position.
- float posCurrent

  The joint's current position in radians/mm relative to its zero position.
- float posError

  The joint's position error in radians/mm, relative to its setpoint.
- uint8_t isMoving

  Whether the joint is in a "moving" state.
- uint8_t motorNum

  Link to the corresponding motor_descriptor.
- float Kp

  PID controller Kp.
- float KpTi

  PID controller Kp/Ti.
- float Kd

  PID controller Kd.
- float intError

  Positional integral error.
- uint8_t * jointName

  The joint's human readable name. This field must be last.

3.6.1 Detailed Description

Joint controller information database.

3.6.2 Member Data Documentation

3.6.2.1 hasAccelerometer

```
uint8_t joint_controller_descriptor::hasAccelerometer
```

Whether the joint has an accelerometer for position control.

3.6.2.2 intError

```
float joint_controller_descriptor::intError
```

Positional integral error.

3.6.2.3 isMoving

```
uint8_t joint_controller_descriptor::isMoving
```

Whether the joint is in a "moving" state.

3.6.2.4 jointName

```
uint8_t* joint_controller_descriptor::jointName
```

The joint's human readable name. This field must be last.

3.6.2.5 Kd

```
float joint_controller_descriptor::Kd
```

PID controller Kd.

3.6.2.6 Kp

```
float joint_controller_descriptor::Kp
```

PID controller Kp.

3.6.2.7 KpTi

```
float joint_controller_descriptor::KpTi
```

PID controller Kp/Ti.

3.6.2.8 motorNum

```
uint8_t joint_controller_descriptor::motorNum
```

Link to the corresponding motor_descriptor.

3.6.2.9 posCurrent

```
float joint_controller_descriptor::posCurrent
```

The joint's current position in radians/mm relative to its zero position.

3.6.2.10 posError

```
float joint_controller_descriptor::posError
```

The joint's position error in radians/mm, relative to its setpoint.

3.6.2.11 posSetpoint

```
float joint_controller_descriptor::posSetpoint
```

The joint's setpoint in radians/mm relative to its zero position.

The documentation for this struct was generated from the following file:

- joint_controller.h

3.7 motor_descriptor Struct Reference

Contains static and state information relevant to the operation of a motor driver.

```
#include <motor_driver.h>
```

Public Attributes

- uint8_t motorId
  The motor's unique ID, essential for CAN messaging.
- uint8_t voltageLimit
  Safe voltage limit, as stated in the motor's datasheet.
- uint8_t voltagePctCap
  Safe voltage percentage cap, given by input voltage and safe limit.
- int8_t motorPolarity
  The motor's polarity, which pole is connected to +/- on the driver.
- TIM_TypeDef * motorTimer
  The MCU timer peripheral which drives the motor.
- TIM_TypeDef * encoderTimer
  The MCU timer peripheral which registers the motor's encoder.
- int32_t resolution
  Relation between number of encoder click per mm or rad of movement.

- uint16_t encoderInitCount

  Number of encoder clicks counted on startup (nominally 0)
- int32_t encoderTotalInit

  Number of total encoder clicks counted on startup (nominally 0)
- int32_t encoderTotalSetpoint

  Setpoint for motor encoder count, relevant if circumventing joint controller.
- int32_t encoderTotalCount

  Total number of encoder clicks registered since startup.
- int32_t encoderPreviousCount

  The previous total encoder count, used for updating total.
- int32_t mostRecentDelta

  The most recently registered increment/decrement in encoder count, essentially movement rate.
- uint8_t isMoving

  Whether the motor is moving, assumed true if mostRecentDelta>50.
- char * motorName

  Human readable name of the motor.

3.7.1 Detailed Description

Contains static and state information relevant to the operation of a motor driver.

3.7.2 Member Data Documentation

3.7.2.1 encoderInitCount

```
uint16_t motor_descriptor::encoderInitCount
```

Number of encoder clicks counted on startup (nominally 0)

3.7.2.2 encoderPreviousCount

```
int32_t motor_descriptor::encoderPreviousCount
```

The previous total encoder count, used for updating total.

3.7.2.3 encoderTimer

```
TIM_TypeDef* motor_descriptor::encoderTimer
```

The MCU timer peripheral which registers the motor's encoder.

3.7.2.4 encoderTotalCount

```
int32_t motor_descriptor::encoderTotalCount
```

Total number of encoder clicks registered since startup.

3.7.2.5 encoderTotalInit

```
int32_t motor_descriptor::encoderTotalInit
```

Number of total encoder clicks counted on startup (nominally 0)

3.7.2.6 encoderTotalSetpoint

```
int32_t motor_descriptor::encoderTotalSetpoint
```

Setpoint for motor encoder count, relevant if circumventing joint controller.

3.7.2.7 isMoving

```
uint8_t motor_descriptor::isMoving
```

Whether the motor is moving, assumed true if mostRecentDelta>50.

3.7.2.8 mostRecentDelta

```
int32_t motor_descriptor::mostRecentDelta
```

The most recently registered increment/decrement in encoder count, essentially movement rate.

3.7.2.9 motorId

```
uint8_t motor_descriptor::motorId
```

The motor's unique ID, essential for CAN messaging.

3.7.2.10 motorName

```
char* motor_descriptor::motorName
```

Human readable name of the motor.

3.7.2.11 motorPolarity

```
int8_t motor_descriptor::motorPolarity
```

The motor's polarity, which pole is connected to +/- on the driver.

3.7.2.12 motorTimer

```
TIM_TypeDef* motor_descriptor::motorTimer
```

The MCU timer peripheral which drives the motor.

3.7.2.13 resolution

```
int32_t motor_descriptor::resolution
```

Relation between number of encoder click per mm or rad of movement.

3.7.2.14 voltageLimit

```
uint8_t motor_descriptor::voltageLimit
```

Safe voltage limit, as stated in the motor's datasheet.

3.7.2.15 voltagePctCap

```
uint8_t motor_descriptor::voltagePctCap
```

Safe voltage percentage cap, given by input voltage and safe limit.

The documentation for this struct was generated from the following file:

- motor_driver.h

3.8 string_cmd_pair Struct Reference

Pairs a command string token with a function pointer.

`#include <string_cmd_parser.h>`

Public Attributes

- char * cmdString
  String token.
- void(* cmdFuncPointer)()
  Corresponding handler function.

3.8.1 Detailed Description

Pairs a command string token with a function pointer.

3.8.2 Member Data Documentation

3.8.2.1 cmdFuncPointer

```
void(* string_cmd_pair::cmdFuncPointer) ()
```

Corresponding handler function.

3.8.2.2 cmdString

```
char* string_cmd_pair::cmdString
```

String token.

The documentation for this struct was generated from the following file:

- string_cmd_parser.h

3.9 string_cmd_processor_args Struct Reference

Wrapper struct to enable a variable number of arguments to the string processor.

`#include <string_cmd_parser.h>`

Public Attributes

- char * inputString [64]

  String to be processed.
- uint8_t stringLength

  Length of the string to be processed.

3.9.1 Detailed Description

Wrapper struct to enable a variable number of arguments to the string processor.

3.9.2 Member Data Documentation

3.9.2.1 inputString

```
char* string_cmd_processor_args::inputString[64]
```

String to be processed.

3.9.2.2 stringLength

```
uint8_t string_cmd_processor_args::stringLength
```

Length of the string to be processed.

The documentation for this struct was generated from the following file:

- string_cmd_parser.h

Chapter 4

File Documentation

4.1 accelerometer_driver.h File Reference

```
#include "uart_driver.h"
#include "unit_config.h"
#include "i2c.h"
#include "stdint.h"
#include "string.h"
```

Include dependency graph for accelerometer_driver.h:

4.2 adc_driver.h File Reference

This file contains all the function prototypes and struct definitions for the adc_driver.c file.

```
#include "stdint.h"
#include "math.h"
#include "adc.h"
#include "unit_config.h"
#include "uart_driver.h"
```

Include dependency graph for adc_driver.h:

Classes

- struct current_measurement_descriptor

  Database with key information for the motor current sensing ADCs.

Functions

- double adc_interface_get_current (uint8_t sensorSelect)

  Module external interface function to read the most recently calculated current.
- void adc_interface_update_current (uint8_t sensorSelect)

  Module external interface function to trigger a current calculation.
- double adc_driver_calculate_current (current_measurement_descriptor *sensor)

  Calculates current in Ampere based on an ADC raw value.
- void adc_driver_update_reading (current_measurement_descriptor *sensor)

  Trigger a reading of the relevant ADC, insert into sensor struct.
- void adc_driver_update_measurement (current_measurement_descriptor *sensor)

  Calculate lastest current measurement, insert into struct.

4.2.1 Detailed Description

This file contains all the function prototypes and struct definitions for the adc_driver.c file.

Attention

ADC driver for the TTK4900 Master project of Kristian Blom, spring semester of 2024. This driver is tailored for use with the current sense pin of the DRV8251A motor driver

4.2.2 Function Documentation

4.2.2.1 adc_driver_calculate_current()

```
double adc_driver_calculate_current (
            current_measurement_descriptor * sensor )
```

Calculates current in Ampere based on an ADC raw value.

Parameters

sensor	Pointer to the relevant sensor struct

Returns

Ampere

4.2.2.2 adc_driver_update_measurement()

```
void adc_driver_update_measurement (
            current_measurement_descriptor * sensor )
```

Calculate lastest current measurement, insert into struct.

Parameters

sensor	Pointer to the relevant sensor struct

4.2.2.3 adc_driver_update_reading()

```
void adc_driver_update_reading (
            current_measurement_descriptor * sensor )
```

Trigger a reading of the relevant ADC, insert into sensor struct.

Parameters

sensor	Pointer to the relevant sensor struct

4.2.2.4 adc_interface_get_current()

```
double adc_interface_get_current (
            uint8_t sensorSelect )
```

Module external interface function to read the most recently calculated current.

Parameters

sensorSelect	Select from one of two motor current sensor ADCs

Returns

Latest calculated current measurement

4.2.2.5 adc_interface_update_current()

```
void adc_interface_update_current (
            uint8_t sensorSelect )
```

Module external interface function to trigger a current calculation.

Parameters

sensorSelect	Select from of two motor current sensor ADCs

4.3 can_driver.h File Reference

This file contains all the function prototypes and struct definitions for the can_driver.c file.

```
#include "stdint.h"
#include "can.h"
```

```
#include "unit_config.h"
#include "motor_driver.h"
#include "accelerometer_driver.h"
#include "joint_controller.h"
```

Include dependency graph for can_driver.h: This graph shows which files directly or indirectly include this file:

Classes

- struct can_mailbox

  A virtual CAN mailbox for outgoing and incoming messages.

Macros

- #define CAN_MOTOR_CMD_OFFSET 5
- #define CAN_ACC_CMD_OFFSET 8

Enumerations

- enum can_message_type {
  ACC_X_TX , ACC_Y_TX , ACC_Z_TX , ACC_REG_RX ,
  ACC_REG_REQ , JOINT_POS_SP , MOTOR_VLT_SP , JOINT_POS_REQ ,
  JOINT_POS_TX , ACC_X_REQ , ACC_Y_REQ , ACC_Z_REQ ,
  num_types }

  CAN message types.

Functions

- void can_interface_queue_tx (uint8_t mailbox, uint8_t *outData, uint32_t id)

  Module external function for queueing a CAN message for transmit.
- void can_rx_executive ()

  Looks for new incoming CAN messages and handles them. MAIN LOOP ONLY.
- void can_tx_executive ()

  Looks for new CAN messages to send, sends. MAIN LOOP ONLY.
- void can_mailbox_set_data (can_mailbox *mailbox, uint8_t *inData)

  Sets the data field of the given mailbox.
- void can_mailbox_get_data (can_mailbox *mailbox, uint8_t *target)

  Inserts the data field of the given mailbox to target. CAUTION: memcpy 8 bytes.
- void can_mailbox_set_flag (can_mailbox *mailbox)

  Sets the newmsg flag of the given mailbox.
- uint8_t can_mailbox_get_flag (can_mailbox *mailbox)

  Gets the newmsg flag of the given mailbox.
- void can_mailbox_clear_flag (can_mailbox *mailbox)

  Clears the newmsg flag of the given mailbox.
- void can_mailbox_set_id (can_mailbox *mailbox, uint32_t id)

  Sets the CAN message ID field of the given mailbox.
- uint32_t can_mailbox_get_id (can_mailbox *mailbox)

  Gets the CAN message ID of the given mailbox.
- void can_driver_queue_tx (can_mailbox *mailbox, uint8_t *outData, uint32_t id)

  Queues a can message for transmit, driver internal.

- void can_driver_send_msg (uint8_t *data, uint32_t stdId, int dlc, uint8_t hwMailbox)

  Sends a CAN message, is called by can_interface_send_msg.
- void can_cmd_handle_yAcc (uint32_t id, uint8_t *inData)
- void can_cmd_handle_regVal (uint32_t id, uint8_t *inData)

  Handles an incoming accelerometer register message.
- void can_cmd_handle_regReq (uint32_t id, uint8_t *inData)

  Handles an incoming accelerometer read request.
- void can_cmd_handle_motorSp (uint32_t id, uint8_t *inData)

  Handles an incoming motor setpoint.
- void can_cmd_handle_axisReq (uint32_t id, uint8_t *inData)

  Handles an incoming request for accelerometer axis data.
- void can_cmd_handle_axisData (uint32_t id, uint8_t *inData)

  Handles incoming accelerometer axis data.
- void can_driver_cmd_rx0 (uint32_t id, uint8_t *inData)

  "Generic" function to handle CAN message type ACC_X_TX
- void can_driver_cmd_rx1 (uint32_t id, uint8_t *inData)

  "Generic" function to handle CAN message type ACC_Y_TX
- void can_driver_cmd_rx2 (uint32_t id, uint8_t *inData)

  "Generic" function to handle CAN message type ACC_Z_TX
- void can_driver_cmd_rx3 (uint32_t id, uint8_t *inData)

  "Generic" function to handle CAN message type ACC_REG_RX
- void can_driver_cmd_rx4 (uint32_t id, uint8_t *inData)

  "Generic" function to handle CAN message type ACC_REG_REQ
- void can_driver_cmd_rx5 (uint32_t id, uint8_t *inData)

  "Generic" function to handle CAN message type JOINT_POS_SP
- void can_driver_cmd_rx6 (uint32_t id, uint8_t *inData)

  "Generic" function to handle CAN message type MOTOR_VLT_SP
- void can_driver_cmd_rx7 (uint32_t id, uint8_t *inData)

  "Generic" function to handle CAN message type ACC_X_TX
- void can_driver_cmd_rx8 (uint32_t id, uint8_t *inData)

  "Generic" function to handle CAN message type JOINT_POS_TX
- void can_driver_cmd_rx9 (uint32_t id, uint8_t *inData)

  "Generic" function to handle CAN message type ACC_X_REQ
- void can_driver_cmd_rxA (uint32_t id, uint8_t *inData)

  "Generic" function to handle CAN message type ACC_Y_REQ
- void can_driver_cmd_rxB (uint32_t id, uint8_t *inData)

  "Generic" function to handle CAN message type ACC_Z_REQ

4.3.1 Detailed Description

This file contains all the function prototypes and struct definitions for the can_driver.c file.

Attention

CAN driver for the TTK4900 Master project of Kristian Blom, spring semester of 2024. The driver specifies CAN message types relevant to the project, as well as relevant functions for the handling of transmission and reception of messages.

4.3.2 Macro Definition Documentation

4.3.2.1 CAN_ACC_CMD_OFFSET

```
#define CAN_ACC_CMD_OFFSET 8
```

4.3.2.2 CAN_MOTOR_CMD_OFFSET

```
#define CAN_MOTOR_CMD_OFFSET 5
```

4.3.3 Enumeration Type Documentation

4.3.3.1 can_message_type

```
enum can_message_type
```

CAN message types.

Enumerator

ACC_X_TX	A message containting acc/rot X axis.
ACC_Y_TX	A message containting acc/rot Y axis.
ACC_Z_TX	A message containting acc/rot Z axis.
ACC_REG_RX	A message containting an arbitrary accelerometer register value.
ACC_REG_REQ	A message requesting an arbitrary accelerometer register value.
JOINT_POS_SP	A message containing a joint position setpoint.
MOTOR_VLT_SP	A message containting a motor voltage percent setpoint.
JOINT_POS_REQ	A message requesting the position of a joint.
JOINT_POS_TX	A message containing the position of a joint.
ACC_X_REQ	A message requesting acc/rot x axis.
ACC_Y_REQ	A message requesting acc/rot y axis.
ACC_Z_REQ	A message requesting acc/rot z axis.
num_types	Dummy type for counting the number of message types, must always be last.

4.3.4 Function Documentation

4.3.4.1 can_cmd_handle_axisData()

```
void can_cmd_handle_axisData (
            uint32_t id,
            uint8_t * inData )
```

Handles incoming accelerometer axis data.

Parameters

id	Incoming CAN ID
inData	Incoming CAN data

4.3.4.2 can_cmd_handle_axisReq()

```
void can_cmd_handle_axisReq (
            uint32_t id,
            uint8_t * inData )
```

Handles an incoming request for accelerometer axis data.

Parameters

id	Incoming CAN ID
inData	Incoming CAN data

4.3.4.3 can_cmd_handle_motorSp()

```
void can_cmd_handle_motorSp (
            uint32_t id,
            uint8_t * inData )
```

Handles an incoming motor setpoint.

Parameters

id	Incoming CAN ID
inData	Incoming CAN data

4.3.4.4 can_cmd_handle_regReq()

```
void can_cmd_handle_regReq (
```

```
            uint32_t id,
            uint8_t * inData )
```

Handles an incoming accelerometer read request.

Parameters

id	Incoming CAN ID
inData	Incoming CAN data

4.3.4.5 can_cmd_handle_regVal()

```
void can_cmd_handle_regVal (
            uint32_t id,
            uint8_t * inData )
```

Handles an incoming accelerometer register message.

Parameters

id	Incoming CAN ID
inData	Incoming CAN data

4.3.4.6 can_cmd_handle_yAcc()

```
void can_cmd_handle_yAcc (
            uint32_t id,
            uint8_t * inData )
```

4.3.4.7 can_driver_cmd_rx0()

```
void can_driver_cmd_rx0 (
            uint32_t id,
            uint8_t * inData )
```

"Generic" function to handle CAN message type ACC_X_TX

Parameters

id	CAN message ID
inData	CAN message data field

4.3.4.8 can_driver_cmd_rx1()

```
void can_driver_cmd_rx1 (
            uint32_t id,
            uint8_t * inData )
```

"Generic" function to handle CAN message type ACC_Y_TX

Parameters

id	CAN message ID
inData	CAN message data field

4.3.4.9 can_driver_cmd_rx2()

```
void can_driver_cmd_rx2 (
            uint32_t id,
            uint8_t * inData )
```

"Generic" function to handle CAN message type ACC_Z_TX

Parameters

id	CAN message ID
inData	CAN message data field

4.3.4.10 can_driver_cmd_rx3()

```
void can_driver_cmd_rx3 (
            uint32_t id,
            uint8_t * inData )
```

"Generic" function to handle CAN message type ACC_REG_RX

Parameters

id	CAN message ID
inData	CAN message data field

4.3.4.11 can_driver_cmd_rx4()

```
void can_driver_cmd_rx4 (
            uint32_t id,
            uint8_t * inData )
```

"Generic" function to handle CAN message type ACC_REG_REQ

Parameters

id	CAN message ID
inData	CAN message data field

4.3.4.12 can_driver_cmd_rx5()

```
void can_driver_cmd_rx5 (
            uint32_t id,
            uint8_t * inData )
```

"Generic" function to handle CAN message type JOINT_POS_SP

Parameters

id	CAN message ID
inData	CAN message data field

4.3.4.13 can_driver_cmd_rx6()

```
void can_driver_cmd_rx6 (
            uint32_t id,
            uint8_t * inData )
```

"Generic" function to handle CAN message type MOTOR_VLT_SP

Parameters

id	CAN message ID
inData	CAN message data field

4.3.4.14 can_driver_cmd_rx7()

```
void can_driver_cmd_rx7 (
```

```
            uint32_t id,
            uint8_t * inData )
```

"Generic" function to handle CAN message type ACC_X_TX

Parameters

id	CAN message ID
inData	CAN message data field

4.3.4.15 can_driver_cmd_rx8()

```
void can_driver_cmd_rx8 (
            uint32_t id,
            uint8_t * inData )
```

"Generic" function to handle CAN message type JOINT_POS_TX

Parameters

id	CAN message ID
inData	CAN message data field

4.3.4.16 can_driver_cmd_rx9()

```
void can_driver_cmd_rx9 (
            uint32_t id,
            uint8_t * inData )
```

"Generic" function to handle CAN message type ACC_X_REQ

Parameters

id	CAN message ID
inData	CAN message data field

4.3.4.17 can_driver_cmd_rxA()

```
void can_driver_cmd_rxA (
            uint32_t id,
            uint8_t * inData )
```

"Generic" function to handle CAN message type ACC_Y_REQ

Parameters

id	CAN message ID
inData	CAN message data field

4.3.4.18 can_driver_cmd_rxB()

```
void can_driver_cmd_rxB (
            uint32_t id,
            uint8_t * inData )
```

"Generic" function to handle CAN message type ACC_Z_REQ

Parameters

id	CAN message ID
inData	CAN message data field

4.3.4.19 can_driver_queue_tx()

```
void can_driver_queue_tx (
            can_mailbox * mailbox,
            uint8_t * outData,
            uint32_t id )
```

Queues a can message for transmit, driver internal.

Parameters

mailbox	Mailbox struct in which data will be placed
outData	Data to send (8 bytes)
id	CAN transmit ID

4.3.4.20 can_driver_send_msg()

```
void can_driver_send_msg (
            uint8_t * data,
            uint32_t stdId,
            int dlc,
            uint8_t hwMailbox )
```

Sends a CAN message, is called by can_interface_send_msg.

Parameters

data	Data to send, max 8 bytes
stdId	Message ID required for rx handling
dlc	Number of bytes to send
hwMailbox	Hardware(!) mailbox to queue to

4.3.4.21 can_interface_queue_tx()

```
void can_interface_queue_tx (
            uint8_t mailbox,
            uint8_t * outData,
            uint32_t id )
```

Module external function for queueing a CAN message for transmit.

Parameters

mailbox	Mailbox number, must correspond to the correct message type
outData	Data to send
id	CAN transmit ID

4.3.4.22 can_mailbox_clear_flag()

```
void can_mailbox_clear_flag (
            can_mailbox * mailbox )
```

Clears the newmsg flag of the given mailbox.

Parameters

mailbox	Mailbox to clear flag from

4.3.4.23 can_mailbox_get_data()

```
void can_mailbox_get_data (
            can_mailbox * mailbox,
            uint8_t * target )
```

Inserts the data field of the given mailbox to target. CAUTION: memcpy 8 bytes.

Parameters

mailbox	Mailbox to retrieve data from
target	Pointer to data target

4.3.4.24 can_mailbox_get_flag()

```
uint8_t can_mailbox_get_flag (
            can_mailbox * mailbox )
```

Gets the newmsg flag of the given mailbox.

Parameters

mailbox	Mailbox to get

Returns

Mailbox' newmsg flag

4.3.4.25 can_mailbox_get_id()

```
uint32_t can_mailbox_get_id (
            can_mailbox * mailbox )
```

Gets the CAN message ID of the given mailbox.

Parameters

mailbox	Mailbox to get ID from

Returns

CAN message ID

4.3.4.26 can_mailbox_set_data()

```
void can_mailbox_set_data (
            can_mailbox * mailbox,
            uint8_t * inData )
```

Sets the data field of the given mailbox.

Parameters

mailbox	Mailbox to insert data into
inData	Data to insert

4.3.4.27 can_mailbox_set_flag()

```
void can_mailbox_set_flag (
            can_mailbox * mailbox )
```

Sets the newmsg flag of the given mailbox.

Parameters

mailbox	Mailbox to set flag

4.3.4.28 can_mailbox_set_id()

```
void can_mailbox_set_id (
            can_mailbox * mailbox,
            uint32_t id )
```

Sets the CAN message ID field of the given mailbox.

Parameters

mailbox	Mailbox to insert ID
id	CAN message ID to insert

4.3.4.29 can_rx_executive()

```
void can_rx_executive ( )
```

Looks for new incoming CAN messages and handles them. MAIN LOOP ONLY.

4.3.4.30 can_tx_executive()

```
void can_tx_executive ( )
```

Looks for new CAN messages to send, sends. MAIN LOOP ONLY.

4.4 gpio_driver.h File Reference

This file contains all the function prototypes for the gpio_driver.c file.

```
#include "stdint.h"
#include "gpio.h"
#include "can_driver.h"
#include "joint_controller.h"
#include "unit_config.h"
```

Include dependency graph for gpio_driver.h:

Functions

- void gpio_end_switch_handler ()

  Handler function for the rail end switch.
- void gpio_twist_switch_handler ()

  Handler function for the twist joint end switch.

4.4.1 Detailed Description

This file contains all the function prototypes for the gpio_driver.c file.

Attention

GPIO driver for the TTK4900 Master project of Kristian Blom, spring semester of 2024. The driver handles GPIO interrupts from the end switch and twist joint optical sensors. The functions are called from the HAL_GPIO_EXTI↩ _Callback function declared in stm32fxx_hal_gpio.h

4.4.2 Function Documentation

4.4.2.1 gpio_end_switch_handler()

```
void gpio_end_switch_handler ( )
```

Handler function for the rail end switch.

4.4.2.2 gpio_twist_switch_handler()

```
void gpio_twist_switch_handler ( )
```

Handler function for the twist joint end switch.

4.5 joint_controller.h File Reference

This file contains all the function prototypes and struct definitions for the joint_controller.c file.

```
#include "stdint.h"
#include "math.h"
#include "tim.h"
#include "unit_config.h"
#include "uart_driver.h"
#include "motor_driver.h"
#include "can_driver.h"
#include "accelerometer_driver.h"
```

Include dependency graph for joint_controller.h: This graph shows which files directly or indirectly include this file:

Classes

- struct joint_controller_descriptor

  Joint controller information database.
- struct accelerometer_inData

  Holds INCOMING accelerometer data, NOT part of the accelerometer driver.

Functions

- float controller_interface_get_setpoint (uint8_t controllerSelect)

  Public function to get the current positional setpoint of a joint.
- void controller_interface_set_setpoint (uint8_t controllerSelect, float setPoint)

  Public function to get the current positional setpoint of a joint.
- float controller_interface_get_position (uint8_t controllerSelect)

  Public function to set the positional setpoint of a joint.
- void controller_interface_set_position (uint8_t controllerSelect, float position)

  Public function to get the current position of a joint.
- float controller_interface_get_error (uint8_t controllerSelect)

  Public function to get the current positional error of a joint.
- void controller_interface_update_error (uint8_t controllerSelect)

  Public function to trigger a calculation of the joint's positional error.
- void controller_interface_set_error (uint8_t controllerSelect, float error)

  Public function to set the positional error of a joint.
- uint8_t controller_interface_get_moving (uint8_t controllerSelect)

  Public function to get the moving state value of the joint.
- void controller_interface_set_moving (uint8_t controllerSelect)

  Public function to set the moving state flag of the joint.
- void controller_interface_clear_moving (uint8_t controllerSelect)

  Public function to clear the moving state flag of the joint.
- void controller_interface_set_power (uint8_t controllerSelect, float power)

  Public function to set the power of the joint.
- void controller_interface_update_power (uint8_t controllerSelect)

  Public function to trigger an update of the joint's power by PID.
- float controller_interface_clicks_to_pos (uint8_t controllerSelect)

  Public function to convert the joint's associated encoder count to joint position.
- void controller_interface_request_acc_axis (uint8_t controllerSelect, uint8_t accSelect, char axis)

Public function to request an update from the joint's accelerometer via CAN bus; acc and rot.

- int16_t controller_interface_acc_getX (uint8_t accSelect)

  Public function to get the accelerometer X axis acceleration.
- int16_t controller_interface_acc_getY (uint8_t accSelect)

  Public function to get the accelerometer Y axis acceleration.
- int16_t controller_interface_acc_getZ (uint8_t accSelect)

  Public function to get the accelerometer Z axis acceleration.
- void controller_interface_acc_setX (uint8_t accSelect, int16_t accVal)

  Public function to set the accelerometer X axis acceleration.
- void controller_interface_acc_setY (uint8_t accSelect, int16_t accVal)

  Public function to set the accelerometer Y axis acceleration.
- void controller_interface_acc_setZ (uint8_t accSelect, int16_t accVal)

  Public function to set the accelerometer Z axis acceleration.
- int16_t controller_interface_rot_getX (uint8_t accSelect)

  Public function to get the accelerometer X axis rotation rate.
- int16_t controller_interface_rot_getY (uint8_t accSelect)

  Public function to get the accelerometer Y axis rotation rate.
- int16_t controller_interface_rot_getZ (uint8_t accSelect)

  Public function to get the accelerometer Z axis rotation rate.
- void controller_interface_rot_setX (uint8_t accSelect, int16_t rotVal)

  Public function to set the accelerometer X axis rotation rate.
- void controller_interface_rot_setY (uint8_t accSelect, int16_t rotVal)

  Public function to set the accelerometer Y axis rotation rate.
- void controller_interface_rot_setZ (uint8_t accSelect, int16_t rotVal)

  Public function to set the accelerometer Z axis rotation rate.
- uint8_t controller_interface_acc_get_newX (uint8_t accSelect)

  Public function to get the new X acceleration data flag.
- uint8_t controller_interface_acc_get_newY (uint8_t accSelect)

  Public function to get the new Y acceleration data flag.
- uint8_t controller_interface_acc_get_newZ (uint8_t accSelect)

  Public function to get the new Z acceleration data flag.
- void controller_interface_acc_set_newX (uint8_t accSelect)

  Public function to set the new X acceleration data flag.
- void controller_interface_acc_set_newY (uint8_t accSelect)

  Public function to set the new Y acceleration data flag.
- void controller_interface_acc_set_newZ (uint8_t accSelect)

  Public function to set the new Z acceleration data flag.
- void controller_interface_acc_clear_newX (uint8_t accSelect)

  Public function to clear the new X acceleration data flag.
- void controller_interface_acc_clear_newY (uint8_t accSelect)

  Public function to clear the new Y acceleration data flag.
- void controller_interface_acc_clear_newZ (uint8_t accSelect)

  Public function to clear the new Z acceleration data flag.
- uint8_t controller_interface_rot_get_newX (uint8_t accSelect)

  Public function to get the new X rotation data flag.
- uint8_t controller_interface_rot_get_newY (uint8_t accSelect)

  Public function to get the new Y rotation data flag.
- uint8_t controller_interface_rot_get_newZ (uint8_t accSelect)

  Public function to get the new Z rotation data flag.
- void controller_interface_rot_set_newX (uint8_t accSelect)

  Public function to set the new X rotation data flag.

- void controller_interface_rot_set_newY (uint8_t accSelect)

  Public function to set the new Y rotation data flag.
- void controller_interface_rot_set_newZ (uint8_t accSelect)

  Public function to set the new Z rotation data flag.
- void controller_interface_rot_clear_newX (uint8_t accSelect)

  Public function to clear the new X rotation data flag.
- void controller_interface_rot_clear_newY (uint8_t accSelect)

  Public function to clear the new Y rotation data flag.
- void controller_interface_rot_clear_newZ (uint8_t accSelect)

  Public function to clear the new Z rotation data flag.
- uint8_t controller_interface_get_acc_poll ()

  Public function to poll the timer driven accelerometer poll flag.
- uint8_t controller_interface_get_mtr_poll ()

  Public function to read the timer driven motor poll flag.
- void controller_interface_set_acc_poll ()

  Puclic function to set the accelerometer poll flag.
- void controller_interface_set_mtr_poll ()

  Puclic function to set the motor poll flag.
- void controller_interface_clear_acc_poll ()

  Public function to clear the accelerometer poll flag.
- void controller_interface_clear_mtr_poll ()

  Public function to clear the motor poll flag.
- float joint_controller_get_setpoint (joint_controller_descriptor *joint)
- void joint_controller_set_setpoint (joint_controller_descriptor *joint, float setpoint)
- float joint_controller_get_position (joint_controller_descriptor *joint)
- void joint_controller_set_position (joint_controller_descriptor *joint, float position)
- float joint_controller_get_error (joint_controller_descriptor *joint)
- void joint_controller_update_error (joint_controller_descriptor *joint)
- void joint_controller_set_error (joint_controller_descriptor *joint, float error)
- uint8_t joint_controller_get_moving (joint_controller_descriptor *joint)
- void joint_controller_set_moving (joint_controller_descriptor *joint)
- void joint_controller_clear_moving (joint_controller_descriptor *joint)
- void joint_controller_set_power (joint_controller_descriptor *joint, float power)
- void joint_controller_update_power (joint_controller_descriptor *joint)
- float joint_controller_clicks_to_pos (joint_controller_descriptor *joint)
- void joint_controller_adjust_enc_sp (joint_controller_descriptor *joint)
- void joint_controller_request_acc_axis (joint_controller_descriptor *joint, uint8_t accSelect, char axis)
- float joint_controller_acceleration_to_angle (joint_controller_descriptor *joint)
- int16_t controller_acc_getX (accelerometer_inData *accSelect)
- int16_t controller_acc_getY (accelerometer_inData *accSelect)
- int16_t controller_acc_getZ (accelerometer_inData *accSelect)
- void controller_acc_setX (accelerometer_inData *accSelect, int16_t accVal)
- void controller_acc_setY (accelerometer_inData *accSelect, int16_t accVal)
- void controller_acc_setZ (accelerometer_inData *accSelect, int16_t accVal)
- int16_t controller_rot_getX (accelerometer_inData *accSelect)
- int16_t controller_rot_getY (accelerometer_inData *accSelect)
- int16_t controller_rot_getZ (accelerometer_inData *accSelect)
- void controller_rot_setX (accelerometer_inData *accSelect, int16_t rotVal)
- void controller_rot_setY (accelerometer_inData *accSelect, int16_t rotVal)
- void controller_rot_setZ (accelerometer_inData *accSelect, int16_t rotVal)
- uint8_t controller_acc_get_newX (accelerometer_inData *accSelect)
- uint8_t controller_acc_get_newY (accelerometer_inData *accSelect)
- uint8_t controller_acc_get_newZ (accelerometer_inData *accSelect)

- void controller_acc_set_newX (accelerometer_inData *accSelect)
- void controller_acc_set_newY (accelerometer_inData *accSelect)
- void controller_acc_set_newZ (accelerometer_inData *accSelect)
- void controller_acc_clear_newX (accelerometer_inData *accSelect)
- void controller_acc_clear_newY (accelerometer_inData *accSelect)
- void controller_acc_clear_newZ (accelerometer_inData *accSelect)
- uint8_t controller_rot_get_newX (accelerometer_inData *accSelect)
- uint8_t controller_rot_get_newY (accelerometer_inData *accSelect)
- uint8_t controller_rot_get_newZ (accelerometer_inData *accSelect)
- void controller_rot_set_newX (accelerometer_inData *accSelect)
- void controller_rot_set_newY (accelerometer_inData *accSelect)
- void controller_rot_set_newZ (accelerometer_inData *accSelect)
- void controller_rot_clear_newX (accelerometer_inData *accSelect)
- void controller_rot_clear_newY (accelerometer_inData *accSelect)
- void controller_rot_clear_newZ (accelerometer_inData *accSelect)

4.5.1 Detailed Description

This file contains all the function prototypes and struct definitions for the joint_controller.c file.

Attention

Joint controller for the TTK4900 Master project of Kristian Blom, spring semester of 2024. The controller makes use of the motor driver to implement PID positional control of the two joints for which the relevant MCU is responsible. The accelerometer struct holds data from the joint's accelerometer, where applicable, and is always received via the CAN bus. This makes accelerometer data inherent to joint control, not the accelerometer driver itself.

Private functions are not descibed individually, but correspond to their public counterparts. They take a joint controller descriptor struct as argument, and are called by the public functions.

4.5.2 Function Documentation

4.5.2.1 controller_acc_clear_newX()

```
void controller_acc_clear_newX (
            accelerometer_inData * accSelect )
```

4.5.2.2 controller_acc_clear_newY()

```
void controller_acc_clear_newY (
            accelerometer_inData * accSelect )
```

4.5.2.3 controller_acc_clear_newZ()

```
void controller_acc_clear_newZ (
            accelerometer_inData * accSelect )
```

4.5.2.4 controller_acc_get_newX()

```
uint8_t controller_acc_get_newX (
            accelerometer_inData * accSelect )
```

4.5.2.5 controller_acc_get_newY()

```
uint8_t controller_acc_get_newY (
            accelerometer_inData * accSelect )
```

4.5.2.6 controller_acc_get_newZ()

```
uint8_t controller_acc_get_newZ (
            accelerometer_inData * accSelect )
```

4.5.2.7 controller_acc_getX()

```
int16_t controller_acc_getX (
            accelerometer_inData * accSelect )
```

4.5.2.8 controller_acc_getY()

```
int16_t controller_acc_getY (
            accelerometer_inData * accSelect )
```

4.5.2.9 controller_acc_getZ()

```
int16_t controller_acc_getZ (
            accelerometer_inData * accSelect )
```

4.5.2.10 controller_acc_set_newX()

```
void controller_acc_set_newX (
            accelerometer_inData * accSelect )
```

4.5.2.11 controller_acc_set_newY()

```
void controller_acc_set_newY (
            accelerometer_inData * accSelect )
```

4.5.2.12 controller_acc_set_newZ()

```
void controller_acc_set_newZ (
            accelerometer_inData * accSelect )
```

4.5.2.13 controller_acc_setX()

```
void controller_acc_setX (
            accelerometer_inData * accSelect,
            int16_t accVal )
```

4.5.2.14 controller_acc_setY()

```
void controller_acc_setY (
            accelerometer_inData * accSelect,
            int16_t accVal )
```

4.5.2.15 controller_acc_setZ()

```
void controller_acc_setZ (
            accelerometer_inData * accSelect,
            int16_t accVal )
```

4.5.2.16 controller_interface_acc_clear_newX()

```
void controller_interface_acc_clear_newX (
            uint8_t accSelect )
```

Public function to clear the new X acceleration data flag.

Parameters

accSelect	The relevant accelerometer inData struct

4.5.2.17 controller_interface_acc_clear_newY()

```
void controller_interface_acc_clear_newY (
            uint8_t accSelect )
```

Public function to clear the new Y acceleration data flag.

Parameters

accSelect	The relevant accelerometer inData struct

4.5.2.18 controller_interface_acc_clear_newZ()

```
void controller_interface_acc_clear_newZ (
            uint8_t accSelect )
```

Public function to clear the new Z acceleration data flag.

Parameters

accSelect	The relevant accelerometer inData struct

4.5.2.19 controller_interface_acc_get_newX()

```
uint8_t controller_interface_acc_get_newX (
            uint8_t accSelect )
```

Public function to get the new X acceleration data flag.

Parameters

accSelect	The relevant accelerometer inData struct

Returns

X axis acceleration new data flag

4.5.2.20 controller_interface_acc_get_newY()

```
uint8_t controller_interface_acc_get_newY (
            uint8_t accSelect )
```

Public function to get the new Y acceleration data flag.

Parameters

accSelect	The relevant accelerometer inData struct

Returns

Y axis acceleration new data flag

4.5.2.21 controller_interface_acc_get_newZ()

```
uint8_t controller_interface_acc_get_newZ (
            uint8_t accSelect )
```

Public function to get the new Z acceleration data flag.

Parameters

accSelect	The relevant accelerometer inData struct

Returns

Z axis acceleration new data flag

4.5.2.22 controller_interface_acc_getX()

```
int16_t controller_interface_acc_getX (
            uint8_t accSelect )
```

Public function to get the accelerometer X axis acceleration.

Parameters

accSelect	The relevant accelerometer inData struct

Returns

X axis acceleration raw value

4.5.2.23 controller_interface_acc_getY()

```
int16_t controller_interface_acc_getY (
            uint8_t accSelect )
```

Public function to get the accelerometer Y axis acceleration.

Parameters

accSelect	The relevant accelerometer inData struct

Returns

Y axis acceleration raw value

4.5.2.24 controller_interface_acc_getZ()

```
int16_t controller_interface_acc_getZ (
            uint8_t accSelect )
```

Public function to get the accelerometer Z axis acceleration.

Parameters

accSelect	The relevant accelerometer inData struct

Returns

Z axis acceleration raw value

4.5.2.25 controller_interface_acc_set_newX()

```
void controller_interface_acc_set_newX (
            uint8_t accSelect )
```

Public function to set the new X acceleration data flag.

Parameters

accSelect	The relevant accelerometer inData struct

4.5.2.26 controller_interface_acc_set_newY()

```
void controller_interface_acc_set_newY (
            uint8_t accSelect )
```

Public function to set the new Y acceleration data flag.

Parameters

accSelect	The relevant accelerometer inData struct

4.5.2.27 controller_interface_acc_set_newZ()

```
void controller_interface_acc_set_newZ (
            uint8_t accSelect )
```

Public function to set the new Z acceleration data flag.

Parameters

accSelect	The relevant accelerometer inData struct

4.5.2.28 controller_interface_acc_setX()

```
void controller_interface_acc_setX (
            uint8_t accSelect,
            int16_t accVal )
```

Public function to set the accelerometer X axis acceleration.

Parameters

accSelect	The relevant accelerometer inData struct
accVal	X axis acceleration raw value

4.5.2.29 controller_interface_acc_setY()

```
void controller_interface_acc_setY (
            uint8_t accSelect,
            int16_t accVal )
```

Public function to set the accelerometer Y axis acceleration.

Parameters

accSelect	The relevant accelerometer inData struct
accVal	Y axis acceleration raw value

4.5.2.30 controller_interface_acc_setZ()

```
void controller_interface_acc_setZ (
            uint8_t accSelect,
            int16_t accVal )
```

Public function to set the accelerometer Z axis acceleration.

Parameters

accSelect	The relevant accelerometer inData struct
accVal	Z axis acceleration raw value

4.5.2.31 controller_interface_clear_acc_poll()

```
void controller_interface_clear_acc_poll ( )
```

Public function to clear the accelerometer poll flag.

4.5.2.32 controller_interface_clear_moving()

```
void controller_interface_clear_moving (
            uint8_t controllerSelect )
```

Public function to clear the moving state flag of the joint.

Parameters

controllerSelect	One of two joints available to the MCU

4.5.2.33 controller_interface_clear_mtr_poll()

```
void controller_interface_clear_mtr_poll ( )
```

Public function to clear the motor poll flag.

4.5.2.34 controller_interface_clicks_to_pos()

```
float controller_interface_clicks_to_pos (
            uint8_t controllerSelect )
```

Public function to convert the joint's associated encoder count to joint position.

Parameters

controllerSelect	One of two joints available to the MCU

Returns

Joint position in rads

4.5.2.35 controller_interface_get_acc_poll()

```
uint8_t controller_interface_get_acc_poll ( )
```

Public function to poll the timer driven accelerometer poll flag.

Returns

Status of the accelerometer poll flag

4.5.2.36 controller_interface_get_error()

```
float controller_interface_get_error (
            uint8_t controllerSelect )
```

Public function to get the current positional error of a joint.

Parameters

controllerSelect	One of two joints available to the MCU

Returns

Joint positional error in rads relative to its setpoint

4.5.2.37 controller_interface_get_moving()

```
uint8_t controller_interface_get_moving (
            uint8_t controllerSelect )
```

Public function to get the moving state value of the joint.

Parameters

controllerSelect	One of two joints available to the MCU

Returns

isMoving flag

4.5.2.38 controller_interface_get_mtr_poll()

```
uint8_t controller_interface_get_mtr_poll ( )
```

Public function to read the timer driven motor poll flag.

Returns

Status of the accelerometer poll flag

4.5.2.39 controller_interface_get_position()

```
float controller_interface_get_position (
            uint8_t controllerSelect )
```

Public function to set the positional setpoint of a joint.

Parameters

controllerSelect	One of two joints available to the MCU

Returns

Joint position in radians relative to its zero position

4.5.2.40 controller_interface_get_setpoint()

```
float controller_interface_get_setpoint (
            uint8_t controllerSelect )
```

Public function to get the current positional setpoint of a joint.

Parameters

controllerSelect	One of two joints available to the MCU

Returns

Joint positional setpoints in radians relative to its zero position

4.5.2.41 controller_interface_request_acc_axis()

```
void controller_interface_request_acc_axis (
            uint8_t controllerSelect,
            uint8_t accSelect,
            char axis )
```

Public function to request an update from the joint's accelerometer via CAN bus; acc and rot.

Parameters

controllerSelect	One of two joints available to the MCU
accSelect	(One of) the joint's accelerometer(s)
axis	The axis for which information is requested

4.5.2.42 controller_interface_rot_clear_newX()

```
void controller_interface_rot_clear_newX (
            uint8_t accSelect )
```

Public function to clear the new X rotation data flag.

Parameters

accSelect	The relevant accelerometer inData struct

4.5.2.43 controller_interface_rot_clear_newY()

```
void controller_interface_rot_clear_newY (
            uint8_t accSelect )
```

Public function to clear the new Y rotation data flag.

Parameters

accSelect	The relevant accelerometer inData struct

4.5.2.44 controller_interface_rot_clear_newZ()

```
void controller_interface_rot_clear_newZ (
            uint8_t accSelect )
```

Public function to clear the new Z rotation data flag.

Parameters

accSelect	The relevant accelerometer inData struct

4.5.2.45 controller_interface_rot_get_newX()

```
uint8_t controller_interface_rot_get_newX (
            uint8_t accSelect )
```

Public function to get the new X rotation data flag.

Parameters

accSelect	The relevant accelerometer inData struct

Returns

Z axis rotation new data flag

4.5.2.46 controller_interface_rot_get_newY()

```
uint8_t controller_interface_rot_get_newY (
            uint8_t accSelect )
```

Public function to get the new Y rotation data flag.

Parameters

accSelect	The relevant accelerometer inData struct

Returns

Y axis rotation new data flag

4.5.2.47 controller_interface_rot_get_newZ()

```
uint8_t controller_interface_rot_get_newZ (
            uint8_t accSelect )
```

Public function to get the new Z rotation data flag.

Parameters

accSelect	The relevant accelerometer inData struct

Returns

Z axis rotation new data flag

4.5.2.48 controller_interface_rot_getX()

```
int16_t controller_interface_rot_getX (
            uint8_t accSelect )
```

Public function to get the accelerometer X axis rotation rate.

Parameters

accSelect	The relevant accelerometer inData struct

Returns

X axis rotation rate raw value

4.5.2.49 controller_interface_rot_getY()

```
int16_t controller_interface_rot_getY (
            uint8_t accSelect )
```

Public function to get the accelerometer Y axis rotation rate.

Parameters

accSelect	The relevant accelerometer inData struct

Returns

Y axis rotation rate raw value

4.5.2.50 controller_interface_rot_getZ()

```
int16_t controller_interface_rot_getZ (
            uint8_t accSelect )
```

Public function to get the accelerometer Z axis rotation rate.

Parameters

accSelect	The relevant accelerometer inData struct

Returns

Z axis rotation rate raw value

4.5.2.51 controller_interface_rot_set_newX()

```
void controller_interface_rot_set_newX (
            uint8_t accSelect )
```

Public function to set the new X rotation data flag.

Parameters

accSelect	The relevant accelerometer inData struct

4.5.2.52 controller_interface_rot_set_newY()

```
void controller_interface_rot_set_newY (
            uint8_t accSelect )
```

Public function to set the new Y rotation data flag.

Parameters

accSelect	The relevant accelerometer inData struct

4.5.2.53 controller_interface_rot_set_newZ()

```
void controller_interface_rot_set_newZ (
            uint8_t accSelect )
```

Public function to set the new Z rotation data flag.

Parameters

accSelect	The relevant accelerometer inData struct

4.5.2.54 controller_interface_rot_setX()

```
void controller_interface_rot_setX (
            uint8_t accSelect,
            int16_t rotVal )
```

Public function to set the accelerometer X axis rotation rate.

Parameters

accSelect	The relevant accelerometer inData struct
rotVal	X axis rotation rate raw value

4.5.2.55 controller_interface_rot_setY()

```
void controller_interface_rot_setY (
            uint8_t accSelect,
            int16_t rotVal )
```

Public function to set the accelerometer Y axis rotation rate.

Parameters

accSelect	The relevant accelerometer inData struct
rotVal	Y axis rotation rate raw value

4.5.2.56 controller_interface_rot_setZ()

```
void controller_interface_rot_setZ (
            uint8_t accSelect,
            int16_t rotVal )
```

Public function to set the accelerometer Z axis rotation rate.

Parameters

accSelect	The relevant accelerometer inData struct
rotVal	Z axis rotation rate raw value

4.5.2.57 controller_interface_set_acc_poll()

```
void controller_interface_set_acc_poll ( )
```

Puclic function to set the accelerometer poll flag.

4.5.2.58 controller_interface_set_error()

```
void controller_interface_set_error (
            uint8_t controllerSelect,
            float error )
```

Public function to set the positional error of a joint.

Parameters

controllerSelect	One of two joints available to the MCU
error	Joint positional error in rads

4.5.2.59 controller_interface_set_moving()

```
void controller_interface_set_moving (
            uint8_t controllerSelect )
```

Public function to set the moving state flag of the joint.

Parameters

controllerSelect	One of two joints available to the MCU

4.5.2.60 controller_interface_set_mtr_poll()

```
void controller_interface_set_mtr_poll ( )
```

Puclic function to set the motor poll flag.

4.5.2.61 controller_interface_set_position()

```
void controller_interface_set_position (
            uint8_t controllerSelect,
            float position )
```

Public function to get the current position of a joint.

Parameters

controllerSelect	One of two joints available to the MCU
position	Joint position in rads relative to its zero position

4.5.2.62 controller_interface_set_power()

```
void controller_interface_set_power (
            uint8_t controllerSelect,
            float power )
```

Public function to set the power of the joint.

Parameters

controllerSelect	One of two joints available to the MCU
power	Percentage of maximum power

4.5.2.63 controller_interface_set_setpoint()

```
void controller_interface_set_setpoint (
            uint8_t controllerSelect,
            float setPoint )
```

Public function to get the current positional setpoint of a joint.

Parameters

controllerSelect	One of two joints available to the MCU
setPoint	Joint positional setpoint in rads relative to its zero position

4.5.2.64 controller_interface_update_error()

```
void controller_interface_update_error (
            uint8_t controllerSelect )
```

Public function to trigger a calculation of the joint's positional error.

Parameters

controllerSelect	One of two joints available to the MCU

4.5.2.65 controller_interface_update_power()

```
void controller_interface_update_power (
            uint8_t controllerSelect )
```

Public function to trigger an update of the joint's power by PID.

Parameters

controllerSelect	One of two joints available to the MCU

4.5.2.66 controller_rot_clear_newX()

```
void controller_rot_clear_newX (
            accelerometer_inData * accSelect )
```

4.5.2.67 controller_rot_clear_newY()

```
void controller_rot_clear_newY (
            accelerometer_inData * accSelect )
```

4.5.2.68 controller_rot_clear_newZ()

```
void controller_rot_clear_newZ (
            accelerometer_inData * accSelect )
```

4.5.2.69 controller_rot_get_newX()

```
uint8_t controller_rot_get_newX (
            accelerometer_inData * accSelect )
```

4.5.2.70 controller_rot_get_newY()

```
uint8_t controller_rot_get_newY (
            accelerometer_inData * accSelect )
```

4.5.2.71 controller_rot_get_newZ()

```
uint8_t controller_rot_get_newZ (
            accelerometer_inData * accSelect )
```

4.5.2.72 controller_rot_getX()

```
int16_t controller_rot_getX (
            accelerometer_inData * accSelect )
```

4.5.2.73 controller_rot_getY()

```
int16_t controller_rot_getY (
            accelerometer_inData * accSelect )
```

4.5.2.74 controller_rot_getZ()

```
int16_t controller_rot_getZ (
            accelerometer_inData * accSelect )
```

4.5.2.75 controller_rot_set_newX()

```
void controller_rot_set_newX (
            accelerometer_inData * accSelect )
```

4.5.2.76 controller_rot_set_newY()

```
void controller_rot_set_newY (
            accelerometer_inData * accSelect )
```

4.5.2.77 controller_rot_set_newZ()

```
void controller_rot_set_newZ (
            accelerometer_inData * accSelect )
```

4.5.2.78 controller_rot_setX()

```
void controller_rot_setX (
            accelerometer_inData * accSelect,
            int16_t rotVal )
```

4.5.2.79 controller_rot_setY()

```
void controller_rot_setY (
            accelerometer_inData * accSelect,
            int16_t rotVal )
```

4.5.2.80 controller_rot_setZ()

```
void controller_rot_setZ (
            accelerometer_inData * accSelect,
            int16_t rotVal )
```

4.5.2.81 joint_controller_acceleration_to_angle()

```
float joint_controller_acceleration_to_angle (
            joint_controller_descriptor * joint )
```

4.5.2.82 joint_controller_adjust_enc_sp()

```
void joint_controller_adjust_enc_sp (
            joint_controller_descriptor * joint )
```

4.5.2.83 joint_controller_clear_moving()

```
void joint_controller_clear_moving (
            joint_controller_descriptor * joint )
```

4.5.2.84 joint_controller_clicks_to_pos()

```
float joint_controller_clicks_to_pos (
            joint_controller_descriptor * joint )
```

4.5.2.85 joint_controller_get_error()

```
float joint_controller_get_error (
            joint_controller_descriptor * joint )
```

4.5.2.86 joint_controller_get_moving()

```
uint8_t joint_controller_get_moving (
            joint_controller_descriptor * joint )
```

4.5.2.87 joint_controller_get_position()

```
float joint_controller_get_position (
            joint_controller_descriptor * joint )
```

4.5.2.88 joint_controller_get_setpoint()

```
float joint_controller_get_setpoint (
            joint_controller_descriptor * joint )
```

Private functions are not described individually, but serve the same purpose as their public counterparts. The joint controller descriptors are static structs defined in the .c file and correspond to the unique joints of the robotic arm.

4.5.2.89 joint_controller_request_acc_axis()

```
void joint_controller_request_acc_axis (
            joint_controller_descriptor * joint,
            uint8_t accSelect,
            char axis )
```

4.5.2.90 joint_controller_set_error()

```
void joint_controller_set_error (
            joint_controller_descriptor * joint,
            float error )
```

4.5.2.91 joint_controller_set_moving()

```
void joint_controller_set_moving (
            joint_controller_descriptor * joint )
```

4.5.2.92 joint_controller_set_position()

```
void joint_controller_set_position (
            joint_controller_descriptor * joint,
            float position )
```

4.5.2.93 joint_controller_set_power()

```
void joint_controller_set_power (
            joint_controller_descriptor * joint,
            float power )
```

4.5.2.94 joint_controller_set_setpoint()

```
void joint_controller_set_setpoint (
            joint_controller_descriptor * joint,
            float setpoint )
```

4.5.2.95 joint_controller_update_error()

```
void joint_controller_update_error (
            joint_controller_descriptor * joint )
```

4.5.2.96 joint_controller_update_power()

```
void joint_controller_update_power (
            joint_controller_descriptor * joint )
```

4.6 motor_driver.h File Reference

This file contains all the function prototypes and struct definitions for the motor_driver.c file.

```
#include "stdint.h"
#include "math.h"
#include "tim.h"
#include "unit_config.h"
#include "uart_driver.h"
```

Include dependency graph for motor_driver.h: This graph shows which files directly or indirectly include this file:

Classes

- struct motor_descriptor

  Contains static and state information relevant to the operation of a motor driver.

Functions

- void motor_interface_controller_init (uint8_t motorSelect)

  Initialize the controller interface.
- void motor_interface_update_power (uint8_t motorSelect)

  Update the power setting of the selected motor based on the relevant controller (P/I/D)
- void motor_interface_update_tot_cnt (uint8_t motorSelect)

  Update the total number of registered encoder counts since init.
- int32_t motor_interface_get_setpoint (uint8_t motorSelect)

  Returns the setpoint of the selected motors.
- int32_t motor_interface_get_total_count (uint8_t motorSelect)

  Returns the number of total registered encoder counts since init.
- uint16_t motor_interface_get_encoder_count (uint8_t motorSelect)

  Returns the current encoder hardware count.
- uint8_t motor_interface_get_id (uint8_t motorSelect)

  Returns the numerical ID of the motor.
- int32_t motor_interface_get_resolution (uint8_t motorSelect)

  Returns the resolution of the motor in encoder clicks per rad or mm.
- uint8_t motor_interface_get_moving (uint8_t motorSelect)

  Returns the isMoving flag.
- void motor_interface_set_power (uint8_t motorSelect, uint8_t direction, double power)

  Lets the user set the motor power setting directly.
- void motor_interface_set_setpoint (uint8_t motorSelect, int32_t setpoint)

  Lets the user set the motor setpoint directly.
- void motor_interface_delta_setpoint (uint8_t motorSelect, int32_t delta)

  Lets the user increment or decrement the motor encoder setpoint.
- void motor_driver_init (motor_descriptor ∗motor)

  Initialise motor controller descriptor.
- void motor_driver_update_power (motor_descriptor ∗motor)

  Sets the power of the selected motor based on a controller heuristic.
- void motor_driver_update_tot_cnt (motor_descriptor ∗motor)

  Updates the encoder total count based on the relevant heuristic.
- int32_t motor_driver_get_setpoint (motor_descriptor ∗motor)

  Gets the total encoder count setpoint of the selected motor.
- int32_t motor_driver_get_total_cnt (motor_descriptor ∗motor)

  Gets the total encoder count since init.
- uint16_t motor_driver_get_encoder_cnt (motor_descriptor ∗motor)

  Gets the current hardware encoder count.
- uint8_t motor_driver_get_id (motor_descriptor ∗motor)
- int32_t motor_driver_get_resolution (motor_descriptor ∗motor)
- uint8_t motor_driver_get_moving (motor_descriptor ∗motor)
- void motor_driver_set_power (motor_descriptor ∗motor, uint8_t direction, double power)

  Set the power of a motor, limited by the motor's safety cap.
- void motor_driver_set_setpoint (motor_descriptor ∗motor, int32_t setpoint)

  Sets the total encoder count setpoint of the selected motor.
- void motor_driver_delta_setpoint (motor_descriptor ∗motor, int32_t delta)

  Changes the encoder setpoint of the relevant motor.
- void motor_driver_set_pwm_dc (uint32_t ∗timerCounter, double pct)

  Sets the duty cycle of the selected PWM timer as a percentage of max.
- void motor_driver_calc_safe_vlt (motor_descriptor ∗motor)

  Calculates the safe power percentage limit based on the descriptor struct.
- void motor_driver_go_forward (double pct, TIM_TypeDef ∗mtr, int8_t polarity)

  Forward is the direction of increasing encoder count.
- void motor_driver_go_backward (double pct, TIM_TypeDef ∗mtr, int8_t polarity)

  Backward is the direction of decreasing encoder count.

4.6.1 Detailed Description

This file contains all the function prototypes and struct definitions for the motor_driver.c file.

Attention

Motor driver for the TTK4900 Master project of Kristian Blom, spring semester of 2024. The driver makes use of the STM32's timer peripheral to generate PWM signals driving the DRV8251A H-bridge motor drivers. The motor descriptor structs hold information relevant to the control of each motor, most importantly the safe voltage limit for each motor embedded in the robotic arm. Additionally, "trip" information such as the total number of encoder counts registered since startup, critical to the state estimation of the arm.

As all STM32s are responsible for the driving of two motors each, the .c file defines two instances of the descriptor struct, motor0 and motor1.

4.6.2 Function Documentation

4.6.2.1 motor_driver_calc_safe_vlt()

```
void motor_driver_calc_safe_vlt (
            motor_descriptor * motor )
```

Calculates the safe power percentage limit based on the descriptor struct.

Parameters

motor	Pointer to the relevant motor struct, motor0 or motor1

4.6.2.2 motor_driver_delta_setpoint()

```
void motor_driver_delta_setpoint (
            motor_descriptor * motor,
            int32_t delta )
```

Changes the encoder setpoint of the relevant motor.

Parameters

motor	Pointer to the relevant motor struct, motor0 or motor1
delta	Change to encoder count setpoint

4.6.2.3 motor_driver_get_encoder_cnt()

```
uint16_t motor_driver_get_encoder_cnt (
            motor_descriptor * motor )
```

Gets the current hardware encoder count.

Parameters

motor	Pointer to the relevant motor struct, motor0 or motor1

Returns

TIMx->CNT

4.6.2.4 motor_driver_get_id()

```
uint8_t motor_driver_get_id (
            motor_descriptor * motor )
```

Parameters

motorSelect	

Returns

4.6.2.5 motor_driver_get_moving()

```
uint8_t motor_driver_get_moving (
            motor_descriptor * motor )
```

Parameters

motor	

Returns

4.6.2.6 motor_driver_get_resolution()

```
int32_t motor_driver_get_resolution (
            motor_descriptor * motor )
```

Parameters

motor	

Returns

4.6.2.7 motor_driver_get_setpoint()

```
int32_t motor_driver_get_setpoint (
            motor_descriptor * motor )
```

Gets the total encoder count setpoint of the selected motor.

Parameters

motor	Pointer to the relevant motor struct, motor0 or motor1

Returns

encoderTotalSetpoint

4.6.2.8 motor_driver_get_total_cnt()

```
int32_t motor_driver_get_total_cnt (
            motor_descriptor * motor )
```

Gets the total encoder count since init.

Parameters

motor	Pointer to the relevant motor struct, motor0 or motor1

Returns

encoderTotalCount

4.6.2.9 motor_driver_go_backward()

```
void motor_driver_go_backward (
            double pct,
            TIM_TypeDef * mtr,
            int8_t polarity )
```

Backward is the direction of decreasing encoder count.

Parameters

pct	Percentage of input voltage
mtr	Pointer to timer

4.6.2.10 motor_driver_go_forward()

```
void motor_driver_go_forward (
            double pct,
            TIM_TypeDef * mtr,
            int8_t polarity )
```

Forward is the direction of increasing encoder count.

Parameters

pct	Percentage of input voltage
mtr	Pointer to timer

4.6.2.11 motor_driver_init()

```
void motor_driver_init (
            motor_descriptor * motor )
```

Initialise motor controller descriptor.

Parameters

motor	Pointer to the relevant motor struct, motor0 or motor1

4.6.2.12 motor_driver_set_power()

```
void motor_driver_set_power (
            motor_descriptor * motor,
```

```
            uint8_t direction,
            double power )
```

Set the power of a motor, limited by the motor's safety cap.

Parameters

motor	Pointer to the relevant motor struct, motor0 or motor1
direction	0 or 1 for forwards or backwards, respectively
power	percentage of input voltage

4.6.2.13 motor_driver_set_pwm_dc()

```
void motor_driver_set_pwm_dc (
            uint32_t * timerCounter,
            double pct )
```

Sets the duty cycle of the selected PWM timer as a percentage of max.

Parameters

timerCounter	Pointer to the relevant TIMx->CNT register
pct	Percentage of maximum duty cycle

4.6.2.14 motor_driver_set_setpoint()

```
void motor_driver_set_setpoint (
            motor_descriptor * motor,
            int32_t setpoint )
```

Sets the total encoder count setpoint of the selected motor.

Parameters

motor	Pointer to the relevant motor struct, motor0 or motor1
setpoint	Total encoder count

4.6.2.15 motor_driver_update_power()

```
void motor_driver_update_power (
            motor_descriptor * motor )
```

Sets the power of the selected motor based on a controller heuristic.

Parameters

motor	Pointer to the relevant motor struct, motor0 or motor1

4.6.2.16 motor_driver_update_tot_cnt()

```
void motor_driver_update_tot_cnt (
            motor_descriptor * motor )
```

Updates the encoder total count based on the relevant heuristic.

Parameters

motor	Pointer to the relevant motor struct, motor0 or motor1

4.6.2.17 motor_interface_controller_init()

```
void motor_interface_controller_init (
            uint8_t motorSelect )
```

Initialize the controller interface.

Parameters

motorSelect	0 or 1 for motor0 or motor1 respectively

4.6.2.18 motor_interface_delta_setpoint()

```
void motor_interface_delta_setpoint (
            uint8_t motorSelect,
            int32_t delta )
```

Lets the user increment or decrement the motor encoder setpoint.

Parameters

motorSelect	0 or 1 for motor0 or motor1 respectively
delta	int32_t, number of encoder clicks by which the setpoint is changed

4.6.2.19 motor_interface_get_encoder_count()

```
uint16_t motor_interface_get_encoder_count (
            uint8_t motorSelect )
```

Returns the current encoder hardware count.

Parameters

motorSelect	0 or 1 for motor0 or motor1 respectively

Returns

TIMx->CNT

4.6.2.20 motor_interface_get_id()

```
uint8_t motor_interface_get_id (
            uint8_t motorSelect )
```

Returns the numerical ID of the motor.

Parameters

motorSelect	0 or 1 for motor0 or motor1 respectively

Returns

motorID

4.6.2.21 motor_interface_get_moving()

```
uint8_t motor_interface_get_moving (
            uint8_t motorSelect )
```

Returns the isMoving flag.

Parameters

motorSelect	0 or 1 for motor0 or motor1 respectively

Returns

isMoving

4.6.2.22 motor_interface_get_resolution()

```
int32_t motor_interface_get_resolution (
            uint8_t motorSelect )
```

Returns the resolution of the motor in encoder clicks per rad or mm.

Parameters

motorSelect	0 or 1 for motor0 or motor1 respectively

Returns

resolution

4.6.2.23 motor_interface_get_setpoint()

```
int32_t motor_interface_get_setpoint (
            uint8_t motorSelect )
```

Returns the setpoint of the selected motors.

Parameters

motorSelect	0 or 1 for motor0 or motor1 respectively

Returns

encoderTotalSetpoint

4.6.2.24 motor_interface_get_total_count()

```
int32_t motor_interface_get_total_count (
            uint8_t motorSelect )
```

Returns the number of total registered encoder counts since init.

Parameters

motorSelect	0 or 1 for motor0 or motor1 respectively

Returns

encoderTotalCount

4.6.2.25 motor_interface_set_power()

```
void motor_interface_set_power (
            uint8_t motorSelect,
            uint8_t direction,
            double power )
```

Lets the user set the motor power setting directly.

Parameters

motorSelect	0 or 1 for motor0 or motor1 respectively
direction	0 or 1 for forwards or backwards, respectively
power	percentage of input voltage

4.6.2.26 motor_interface_set_setpoint()

```
void motor_interface_set_setpoint (
            uint8_t motorSelect,
            int32_t setpoint )
```

Lets the user set the motor setpoint directly.

Parameters

motorSelect	0 or 1 for motor0 or motor1 respectively
setpoint	int32_t

4.6.2.27 motor_interface_update_power()

```
void motor_interface_update_power (
            uint8_t motorSelect )
```

Update the power setting of the selected motor based on the relevant controller (P/I/D)

Parameters

motorSelect	0 or 1 for motor0 or motor1 respectively

4.6.2.28 motor_interface_update_tot_cnt()

```
void motor_interface_update_tot_cnt (
            uint8_t motorSelect )
```

Update the total number of registered encoder counts since init.

Parameters

motorSelect	0 or 1 for motor0 or motor1 respectively

4.7 shoulder_controller.h File Reference

```
#include "string.h"
#include <stdio.h>
#include "math.h"
#include "uart_driver.h"
#include "accelerometer_driver.h"
#include "motor_driver.h"
#include "can_driver.h"
```

Include dependency graph for shoulder_controller.h:

Classes

- struct controller_descriptor

4.8 string_cmd_parser.h File Reference

This file contains all the function prototypes and struct definitions for the string_cmd_parser.c file.

```
#include "string.h"
#include <stdio.h>
#include <stdlib.h>
#include "stdint.h"
#include "unit_config.h"
#include "motor_driver.h"
#include "can_driver.h"
#include "joint_controller.h"
```

Include dependency graph for string_cmd_parser.h: This graph shows which files directly or indirectly include this file:

Classes

- struct string_cmd_processor_args

  Wrapper struct to enable a variable number of arguments to the string processor.
- struct string_cmd_pair

  Pairs a command string token with a function pointer.

Macros

- #define string_cmd_processor(...) string_cmd_processor_wrp((string_cmd_processor_args∗){__VA_↩ ARGS__})
- #define NUM_STRING_COMMANDS 0xA

Functions

- void string_cmd_processor_wrp (string_cmd_processor_args ∗input)

  Wrapper function to enable a variable number of arguments to the string processor.
- void string_cmd_processor_base (char ∗inputString, uint8_t stringLength)

  Starting point for string processing, splits and incoming string into tokens delimited by " ".
- void string_cmd_category_local_motor (uint8_t motor, char(∗inputTokens)[64])

  Handles commands to a motor/joint controller local to the STM32 connected to the serial interface.
- void string_cmd_category_remote_motor (uint8_t motor, char(∗inputTokens)[64])

  Handles commands to a motor/joint controller accessible via CAN from the STM32 connected to the serial interface.
- void string_cmd_category_adc ()

  Handles commands to an ADC (NOTE: Not implemented)
- void string_cmd_category_accelerometer ()

  Handles commands to an accelerometer (NOTE: Not implemented)
- void string_cmd_rail (char(∗inputTokens)[64])

  Called when "rail" token is registered; concerns the rail linear joint.
- void string_cmd_shoulder (char(∗inputTokens)[64])

  Called when "shoulder" token is registered; concerns the shoulder joint.
- void string_cmd_elbow (char(∗inputTokens)[64])

  Called when "elbow" token is registered; concerns the elbow joint.
- void string_cmd_wrist (char(∗inputTokens)[64])

  Called when "wrist" token is registered; concerns the wrist joint.
- void string_cmd_twist (char(∗inputTokens)[64])

  Called when "twist" token is registered; concerns the twist joint.
- void string_cmd_pinch (char(∗inputTokens)[64])

  Called when "pinch" token is registered; concerns the pinch joint.
- void string_cmd_can (char(∗inputTokens)[64])

  Called when "can" token is registered; concerns the CAN bus.
- void string_cmd_stop (char(∗inputTokens)[64])

  Called when "S" token is registered; soft emergency stop for all joints.
- void string_cmd_acc1 (char(∗inputTokens)[64])

  Called when "acc1" token is registered; concerns the shoulder accelerometer.
- void string_cmd_rly (char(∗inputTokens)[64])

  Called when "relay" token is registered; concerns the motor driver enable relays.

Variables

- static string_cmd_pair stringCmdList [NUM_STRING_COMMANDS]

  Pairing of string commands and handler functions.

4.8.1 Detailed Description

This file contains all the function prototypes and struct definitions for the string_cmd_parser.c file.

Attention

Keyboard input string parser for the TTK4900 Master project of Kristian Blom, spring semester of 2024. The parser makes use of the joint controller, motor driver, and the STM32's UART peripheral as well as C string libraries to enable debugging of the arm during development. It lets the user write specified commands to a serial interface such as PuTTy to control joints directly, as well as make sensor readouts on demand.

The string_cmd_pair list defines valid commands available to the user, which may be expanded at will. When using the arm with a serial interface, an input string beginning with one of the defined words will be handled by the corresponding function. In the interest of standardisation, all input strings limited to 64 characters.

4.8.2 Macro Definition Documentation

4.8.2.1 NUM_STRING_COMMANDS

```
#define NUM_STRING_COMMANDS 0xA
```

4.8.2.2 string_cmd_processor

```
#define string_cmd_processor(
              ...  ) string_cmd_processor_wrp((string_cmd_processor_args*){__VA_ARGS__})
```

4.8.3 Function Documentation

4.8.3.1 string_cmd_acc1()

```
void string_cmd_acc1 (
             char(*) inputTokens[64] )
```

Called when "acc1" token is registered; concerns the shoulder accelerometer.

Parameters

inputTokens	Arguments to parse

4.8.3.2 string_cmd_can()

```
void string_cmd_can (
            char(*) inputTokens[64] )
```

Called when "can" token is registered; concerns the CAN bus.

Parameters

inputTokens	Arguments to parse

4.8.3.3 string_cmd_category_accelerometer()

```
void string_cmd_category_accelerometer ( )
```

Handles commands to an accelerometer (NOTE: Not implemented)

4.8.3.4 string_cmd_category_adc()

```
void string_cmd_category_adc ( )
```

Handles commands to an ADC (NOTE: Not implemented)

4.8.3.5 string_cmd_category_local_motor()

```
void string_cmd_category_local_motor (
            uint8_t motor,
            char(*) inputTokens[64] )
```

Handles commands to a motor/joint controller local to the STM32 connected to the serial interface.

Parameters

motor	One of two motors, 0 or 1
inputTokens	Tokens received from the string processor

4.8.3.6 string_cmd_category_remote_motor()

```
void string_cmd_category_remote_motor (
            uint8_t motor,
            char(*) inputTokens[64] )
```

Handles commands to a motor/joint controller accessible via CAN from the STM32 connected to the serial interface.

Parameters

motor	One of two motors, 0 or 1
inputTokens	Tokens received from the string processor

4.8.3.7 string_cmd_elbow()

```
void string_cmd_elbow (
            char(*) inputTokens[64] )
```

Called when "elbow" token is registered; concerns the elbow joint.

Parameters

inputTokens	Arguments to parse

4.8.3.8 string_cmd_pinch()

```
void string_cmd_pinch (
            char(*) inputTokens[64] )
```

Called when "pinch" token is registered; concerns the pinch joint.

Parameters

inputTokens	Arguments to parse

4.8.3.9 string_cmd_processor_base()

```
void string_cmd_processor_base (
            char * inputString,
            uint8_t stringLength )
```

Starting point for string processing, splits and incoming string into tokens delimited by " ".

Parameters

inputString	The string to be processed
stringLength	Length of the string to be processed

4.8.3.10 string_cmd_processor_wrp()

```
void string_cmd_processor_wrp (
            string_cmd_processor_args * input )
```

Wrapper function to enable a variable number of arguments to the string processor.

Parameters

input	Pointer to arguments

4.8.3.11 string_cmd_rail()

```
void string_cmd_rail (
            char(*) inputTokens[64] )
```

Called when "rail" token is registered; concerns the rail linear joint.

Parameters

inputTokens	Arguments to parse

4.8.3.12 string_cmd_rly()

```
void string_cmd_rly (
            char(*) inputTokens[64] )
```

Called when "relay" token is registered; concerns the motor driver enable relays.

Parameters

inputTokens	Arguments to parse

4.8.3.13 string_cmd_shoulder()

```
void string_cmd_shoulder (
            char(*) inputTokens[64] )
```

Called when "shoulder" token is registered; concerns the shoulder joint.

Parameters

inputTokens	Arguments to parse

4.8.3.14 string_cmd_stop()

```
void string_cmd_stop (
            char(*) inputTokens[64] )
```

Called when "S" token is registered; soft emergency stop for all joints.

Parameters

inputTokens	Arguments to parse (none)

4.8.3.15 string_cmd_twist()

```
void string_cmd_twist (
            char(*) inputTokens[64] )
```

Called when "twist" token is registered; concerns the twist joint.

Parameters

inputTokens	Arguments to parse

4.8.3.16 string_cmd_wrist()

```
void string_cmd_wrist (
            char(*) inputTokens[64] )
```

Called when "wrist" token is registered; concerns the wrist joint.

Parameters

inputTokens	Arguments to parse

4.8.4 Variable Documentation

4.8.4.1 stringCmdList

```
string_cmd_pair stringCmdList[NUM_STRING_COMMANDS]  [static]
```

Initial value:

```
=
  {
  {"rail", string_cmd_rail},
  {"shoulder", string_cmd_shoulder},
  {"elbow", string_cmd_elbow},
  {"wrist", string_cmd_wrist},
  {"twist", string_cmd_twist},
  {"pinch", string_cmd_pinch},
  {"can", string_cmd_can},
  {"S", string_cmd_stop},
  {"acc1", string_cmd_acc1},
  {"relay", string_cmd_rly}
  }
```

Pairing of string commands and handler functions.

4.9 uart_driver.h File Reference

This file contains all the function prototypes for the string_cmd_parser.c file.

```
#include "string.h"
#include <stdio.h>
#include "usart.h"
#include "unit_config.h"
#include "string_cmd_parser.h"
```

Include dependency graph for uart_driver.h: This graph shows which files directly or indirectly include this file:

Functions

- void uart_send_string (char *str)

  Sends a string over the UART peripheral interface.
- void uart_parse_input (char *input, uint8_t *buffer, uint8_t bufferLength, uint8_t *bufferPos)

  Reads incoming UART data and enables a keyboard based HMI to the STM32.
- void uart_hmi_rx_handler ()

  Handles incoming UART data when the peripheral is used as HMI.
- void uart_hmi_init ()

  Initializes the UART peripheral as HMI.
- void uart_ros_rx_handler ()

  Handles incoming UART data when the peripheral is used for ROS.
- void uart_ros_init ()

  Initializes the UART peripheral as ROS interface.

4.9.1 Detailed Description

This file contains all the function prototypes for the string_cmd_parser.c file.

Attention

UART serial interface driver for the TTK4900 Master project of Kristian Blom, spring semester of 2024. The driver makes use of the STM32's UART peripheral, as well as the string command parser module and C string libraries to do basic processing of incoming and outgoing UART data.

The parser/handler functions are triggered by the HAL_UART_RxCpltCallback

4.9.2 Function Documentation

4.9.2.1 uart_hmi_init()

```
void uart_hmi_init ( )
```

Initializes the UART peripheral as HMI.

4.9.2.2 uart_hmi_rx_handler()

```
void uart_hmi_rx_handler ( )
```

Handles incoming UART data when the peripheral is used as HMI.

4.9.2.3 uart_parse_input()

```
void uart_parse_input (
            char * input,
            uint8_t * buffer,
            uint8_t bufferLength,
            uint8_t * bufferPos )
```

Reads incoming UART data and enables a keyboard based HMI to the STM32.

Parameters

input	Last incoming byte
buffer	String buffer holding the currently relevant strings
bufferLength	Length of buffer
bufferPos	Keyboard cursor position in buffer

4.9.2.4 uart_ros_init()

```
void uart_ros_init ( )
```

Initializes the UART peripheral as ROS interface.

4.9.2.5 uart_ros_rx_handler()

```
void uart_ros_rx_handler ( )
```

Handles incoming UART data when the peripheral is used for ROS.

4.9.2.6 uart_send_string()

```
void uart_send_string (
            char * str )
```

Sends a string over the UART peripheral interface.

Parameters

str	string to send

4.10 unit_config.h File Reference

This file contains global information relevant to building the project for a specific STM32 in the robotic arm.

4.10.1 Detailed Description

This file contains global information relevant to building the project for a specific STM32 in the robotic arm.

Attention

STM32 project configuration for the TTK4900 Master project of Kristian Blom, spring semester of 2024. This file specifies information unique to each STM32, i.e. the torso, shoulder and hand unit, respectively, as well as some convenience definitions common to all three.

The most important parameter is ACTIVE_UNIT, as this flag specifies which modules will be compiled, CAN message ID filters, and safe power levels for each motor. CAUTION: Flashing an STM32 unit with the wrong ACTIVE↩ _UNIT flag may cause harm to the motors, as an inappropriate safe power level may be calculated for that motor.

4.10.2 Macro Definition Documentation

4.10.2.1 ACTIVE_UNIT

```
#define ACTIVE_UNIT TORSO
```

4.10.2.2 CAN_FILTER_A

```
#define CAN_FILTER_A 0x000
